Di-boson production at the Tevatron

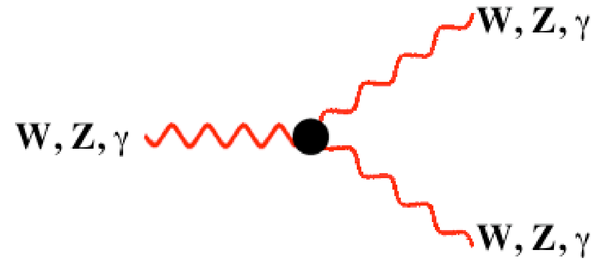
Outline

- Introduction
- WW cross section
- WZ cross section and WWZ couplings
- Wγ cross section and WWγ couplings
- Zγ cross section and tri-neutral couplings
- Conclusions

G. De Lentdecker
University of Rochester
For the CDF and D0 Collaborations
Moriond-EWK 2005, LaThuile, Italy, March 8, 2005

Motivations

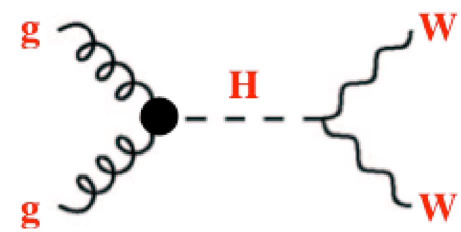
- Non-Abelian structure of SM => triple and quartic gauge boson couplings $\exists$ (ZZγ & Z$\gamma\gamma$ = 0)



- Diboson production

⇒ test of Triple Gauge Couplings (WWγ, WWZ, ZZγ, Z$\gamma\gamma$)

- Tevatron is complementary to LEP:
  - Tevatron probes different coupling combinations than LEP
  - Tevatron explores higher $\hat{S}$
- New physics probe
- Background of numerous analyses (H->WW, SUSY, $t\bar{t}$)



- Knowledge of diboson cross section important for many LHC analyses
- At Run I, low statistics, low significance on diboson signal

WWγ & WWZ Anomalous couplings AC

- All possible interactions terms (WWV; V = γ or Z) in L_{eff}:

$$L_{WWV} / g_{WWV} = \boxed{g_V^1}(W^{\dagger}_{\mu\nu} W^{\mu} V^{\nu} - W^{\dagger}_{\mu} V_{\nu} W^{\mu\nu}) + \boxed{\kappa_V} W^{\dagger}_{\mu} W_{\nu} V^{\mu\nu} + \frac{\boxed{\lambda_V}}{M_W^2} W^{\dagger}_{\lambda\mu} W^{\mu}_{\nu} V^{\nu\lambda}$$

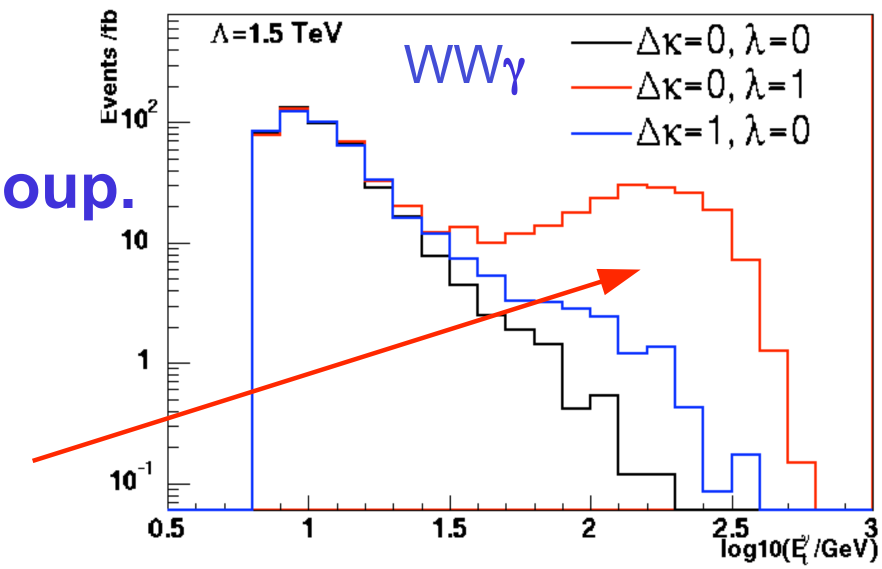
- L_{eff} characterized by 5 CP conserving parameters:

$\lambda_Z = \lambda_\gamma = 0$; $\Delta\kappa_Z = \Delta\kappa_\gamma = 0$ ($\Delta\kappa = \kappa - 1$) and $\Delta g^1_Z = 0$ ($\Delta g^1_Z = g^1_Z - 1$)

- κ and λ related to magnetic dipole and electric quadrupole moments of W:

$$\mu_W = e(1+\kappa+\lambda) / 2M_W$$
$$Q^e_W = - e(\kappa-\lambda) / M^2_W$$

- form-factor scale Λ to avoid unitarity violation
- WW to probe WWγ and WWZ coup.
- Wγ to probe WWγ coupling
- WZ to probe WWZ coupling
- AC effect: X-section increases for high E_T boson



Cut definitions

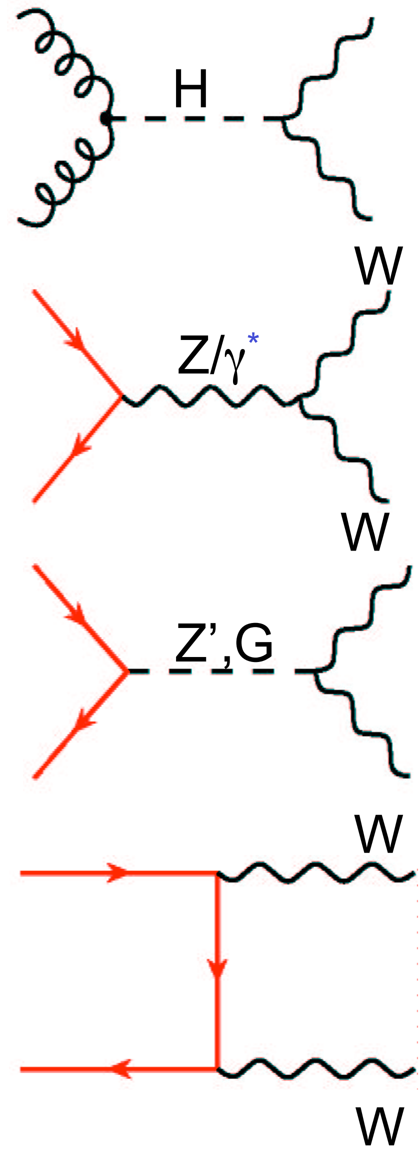
- CDF and D0 use similar cuts
- W/Z selections are based on selection of high-P_T leptons
  - Z->ll, W->lν
- High-P_T leptons
  - Electron or muon with P_T>20-25 GeV/c
  - Isolated = E_T in cone R=0.4 less than 0.1*E_T(lepton)
  - Central = $|\eta|$ <1 (1.1)

- Neutrinos result in mis-balance of transverse energy
  - Large missing E_T: $\not{E}_T$ > 20-25 GeV

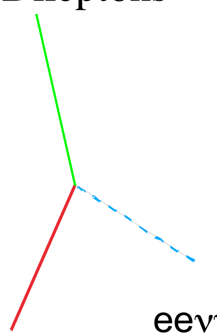
WW production

- Important background for Higgs searches
- Self interaction of heavy bosons (WWγ/Z)
- Probe for new heavy bosons
- Large statistics at LEPII (10K evts/exp.)
- @ Run I, one result (CDF) w/. limited significance: 5 evts observed with 1.3±0.3 bkgrd.

σ (WW) = $10.2^{+6.3}_{-5.1}$(stat) ±1.6 (syst) pb



Dileptons

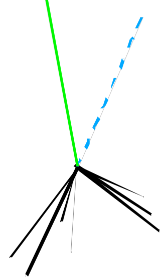


eμνν and eeνν, μμνν

Br = 2.5 and 1.2%

Pure and efficient
Low branching frac.

Lepton+jets

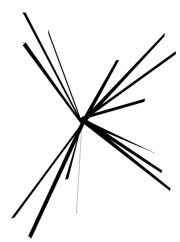


en+jets, μν+jets

Br = 15%

Efficient
Not very pure

All-jets



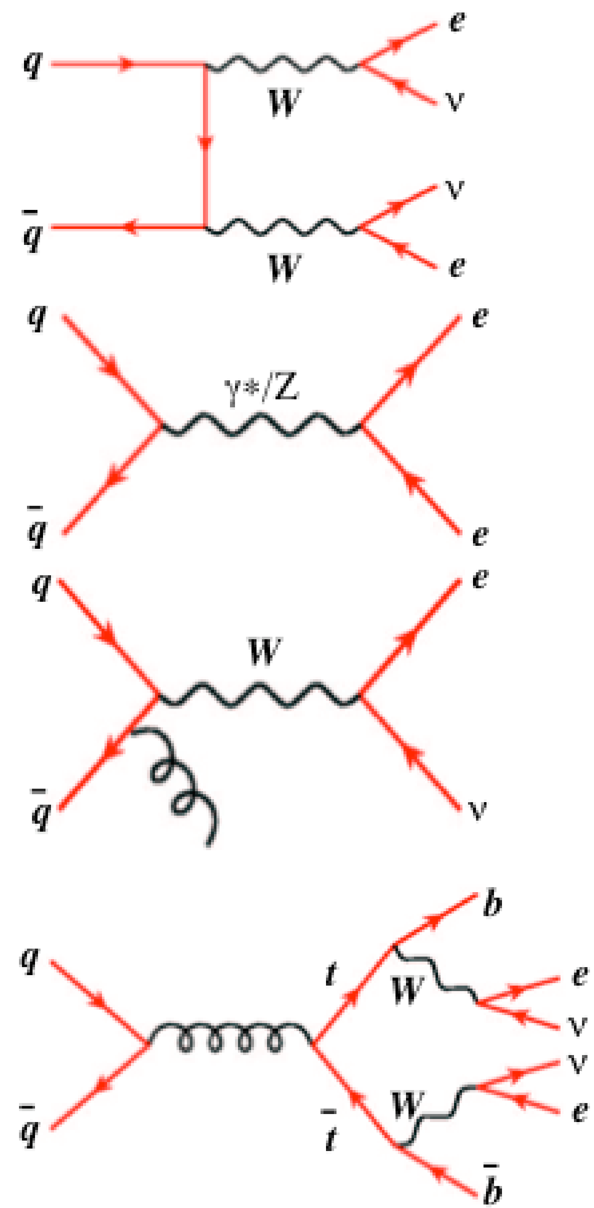
All-jets

Br = 47%

Very efficient
Never Mind

Event selection

- First goal: establish the signal
- Selection:
  - 2 isolated leptons
  - Large $\not\!\!E_T$ (2ν)
- Backrounds:
  - Drell-Yan with “fake” $\not\!\!E_T$
    - σ(pp->Z/γ*->ee) ~ 250 pb
  - W+jets/γ where jet must fake a lepton
    - σ(pp->W(->eν)+≥1jet) ~ 500 pb
  - $t\bar{t}$ (contains additional jets)
    - σ(pp->$t\bar{t}$-> eνeν$b\bar{b}$) ~ 0.1 pb
  - Heavy dibosons (WZ,ZZ) production



WW cross section

	D0 (224-252 pb^{-1})			CDF (184 pb^{-1})		
Process	ee	μμ	eμ	ee	μμ	eμ
WW signal	3.42±0.05	2.10±0.05	11.10±0.10	2.6±0.3	2.5±0.3	5.1±0.6
Total BKGD	2.30±0.21	1.95±0.41	3.81±0.17	$1.9^{+1.3}_{-0.3}$	$1.3^{+1.6}_{-0.4}$	1.9±0.4
Observed	6	4	15	6	6	5

Combined:

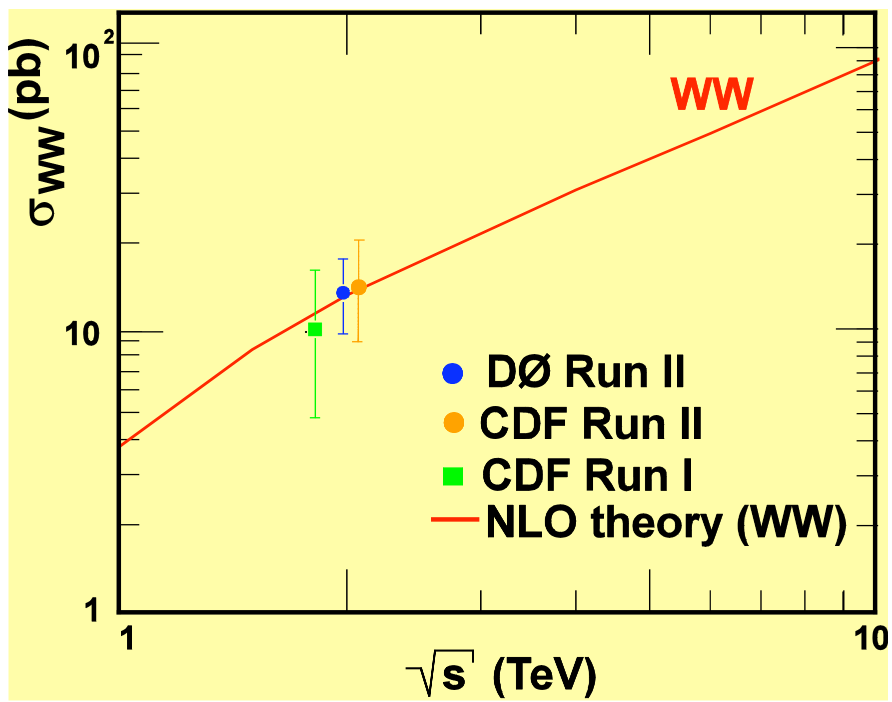
D0: $$\sigma(WW) = 13.8^{+4.3}_{-3.8}(stat.)^{+1.2}_{-0.9}(sys.) \pm 0.9(lum.)\text{ pb}$$

CDF: $$\sigma(WW) = 14.6^{+5.8}_{-5.1}(stat.)^{+1.8}_{-3.0}(sys.) \pm 0.9(lum.)\text{ pb}$$

$\sigma(pp\text{->}WW\text{->}ll\nu\nu)^{THEORY}_{NLO}$ = 12.4±0.8 pb

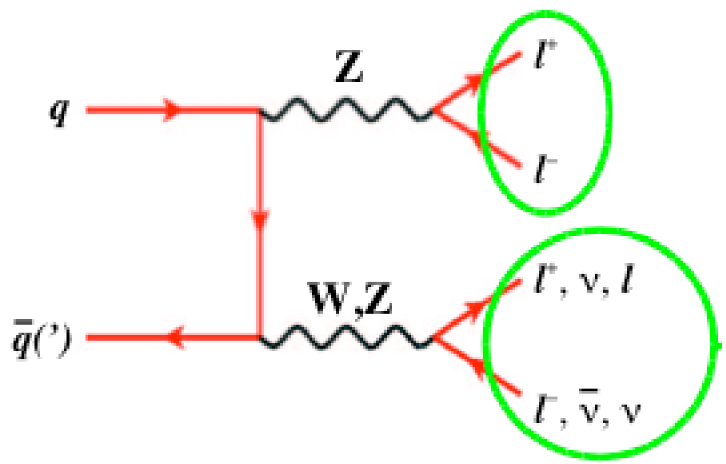
P(background fluc.) = $2.3*10^{-7}$
=> ~ 5.2 standard deviations

Systematics (CDF):
- Selection efficiency ~10%
  (signal modelling ~7%)
- Backgrounds ~40% (D-Y, W+jet)
- Luminosity : 6%



WZ

- Important step towards Higgs searches (significant bkgd)
- Sensitive to the WWZ coupling (and not WWγ as in WW)
- $W^{\pm}Z$ unavailable at e^+e^- colliders => unique meas. of WWZ
- Search for trilepton signature (no other SM process)
- $\sigma_{NLO}(WZ)$ ~ 4.0 pb at 1.96 TeV
- Z selection:
  - 2 high P_T leptons
  - $M_{inv}(ll)$ consistent w/ m_Z
- W selection:
  - Isolated lepton + $\not{E}_T$
- Main background:
  - Z/γ^*+ jet



CDF WZ and ZZ x-sections

Process	4 leptons	3 leptons	2 leptons	Combined

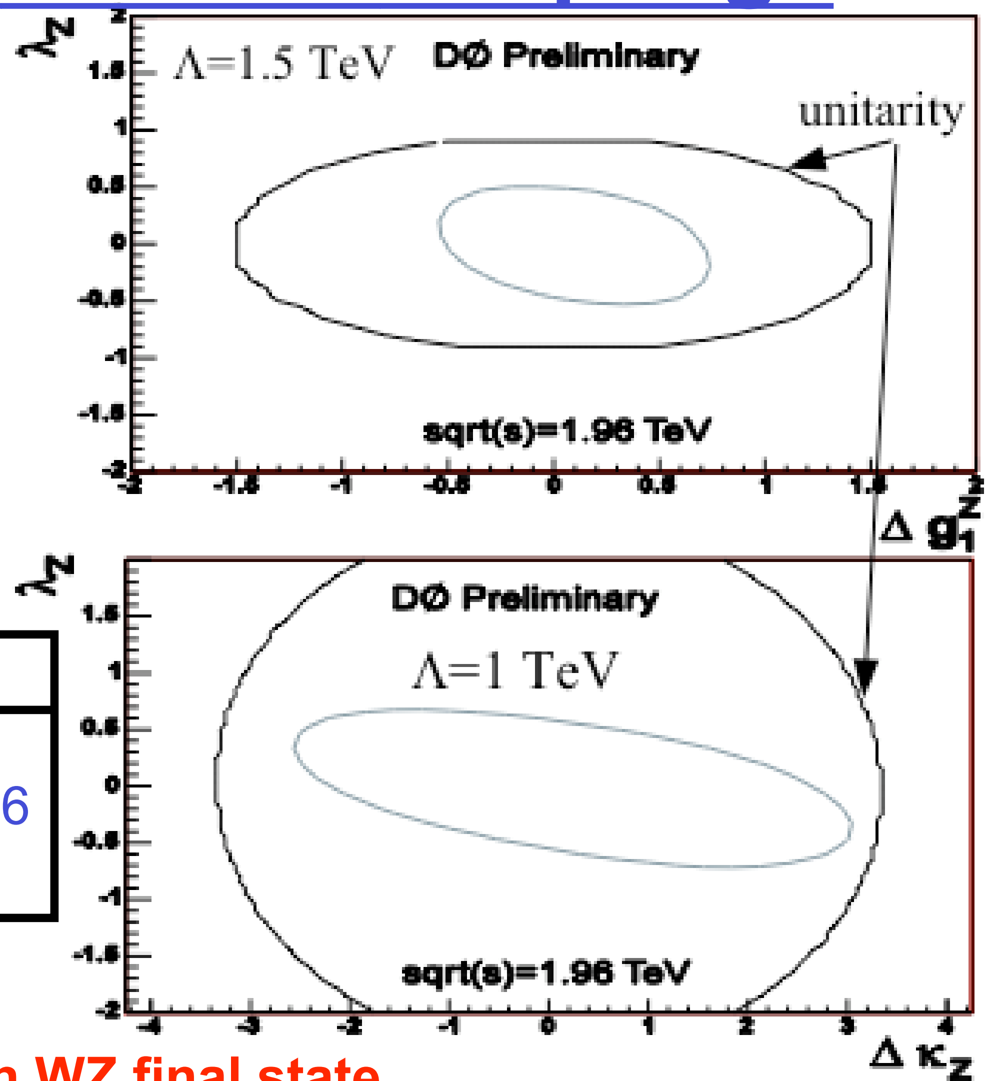
- **Intersect with plane at**

Max-3.0=> 2D limit at 95%CL

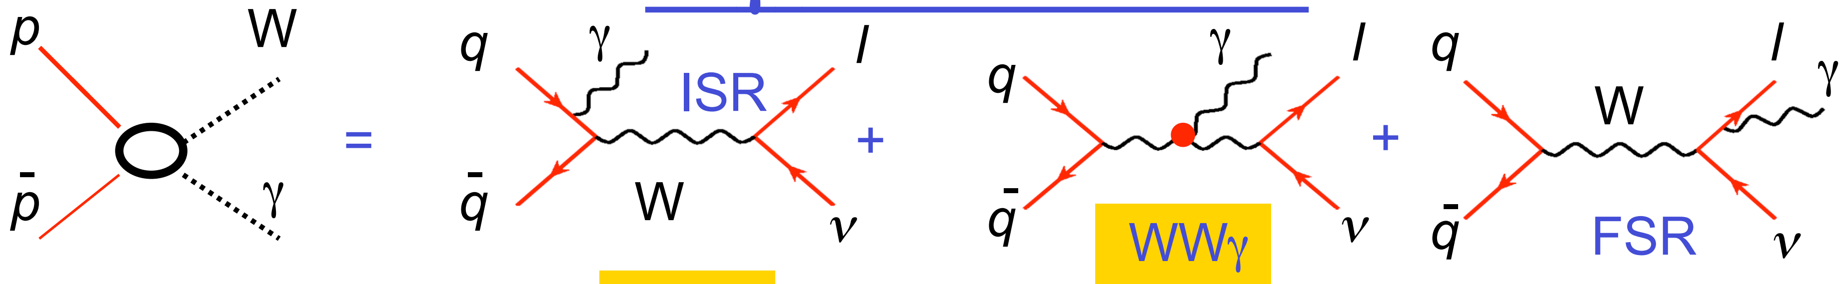


1D limits at 95% CL (D0)

Λ = 1.0 TeV	Λ = 1.5 TeV
$-0.53 < \lambda_Z < 0.56$	$-048 < \lambda_Z < 0.48$
$-0.57 < \Delta g^1_Z < 0.76$	$-0.49 < \Delta g^1_Z < 0.66$
$-2.0 < \Delta\kappa_Z < 2.4$	—

- **Best limits on WWZ couplings in WZ final state**
- **First 2D limits in κ_Z vs λ_Z using WZ**
- **Best limits on Δg^Z_1, $\Delta\kappa_z$ and λ_Z from direct, model independent measur.**
- **D0 Run II 1D limits are x3 better than Run I**

Wγ Production



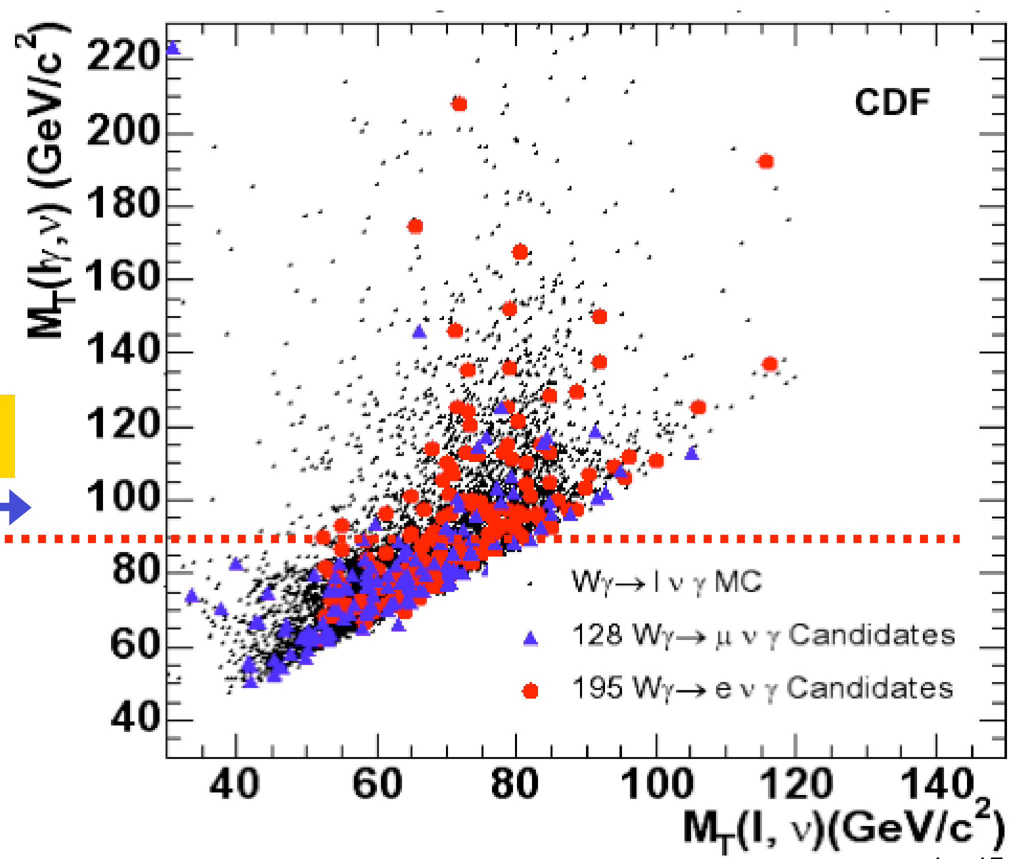
- Sensitive only to WWγ coupling
- Bkgd of Gauge Mediated Supersymmetry Breaking models
- W Selection
  - Isolated high-P_T lepton
  - Large $\not{E}_T$
- γ ID is crucial

  $|\eta| < 1$, $\Delta R(l,\gamma) > 0.7$

Effect of anomalous couplings more pronounced at high $M_T(W\gamma)$

ISR + WWγ

FSR



$W\gamma$ cross section

Decay Channel	D0 $e\nu\gamma$	D0 $\mu\nu\gamma$	CDF $e\nu\gamma$	CDF $\mu\nu\gamma$

Combined*:

D0:

$$\sigma(p\bar{p} \rightarrow W^{\pm}\gamma) = 14.8 \pm 1.6(stat.) \pm 1.0(sys.) \pm 1.0(lum.)\ \mathrm{pb}$$

SM expect: $\sigma(W\gamma)$ = 16.0 ± 0.4 pb

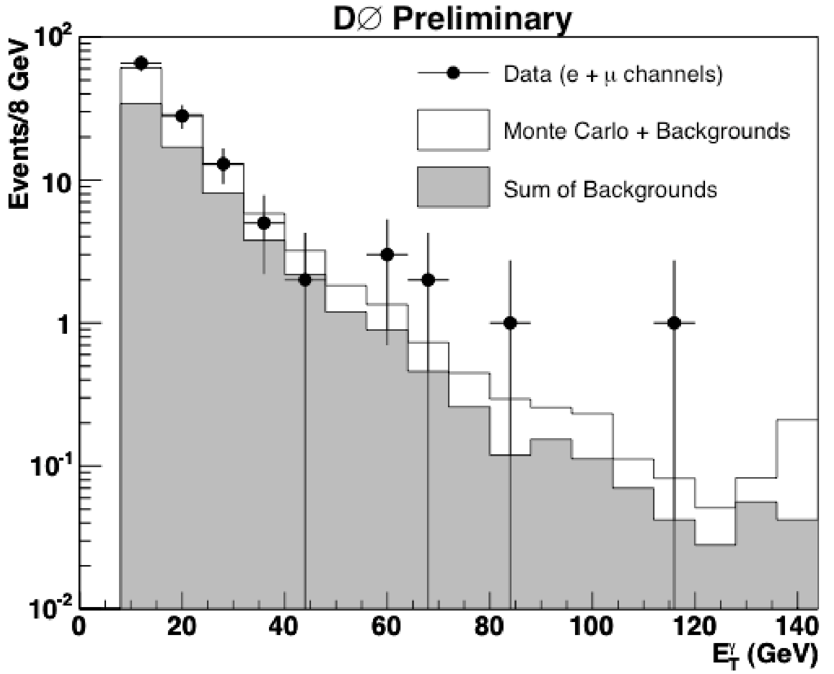
CDF:

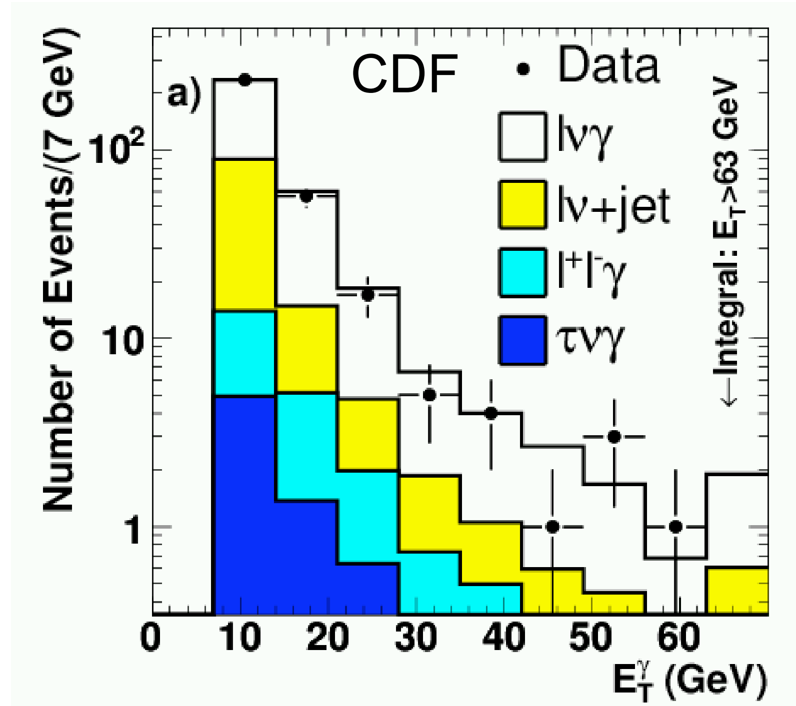
$$\sigma(p\bar{p} \rightarrow W^{\pm}\gamma) = 18.1 \pm 3.1\ \mathrm{pb}$$

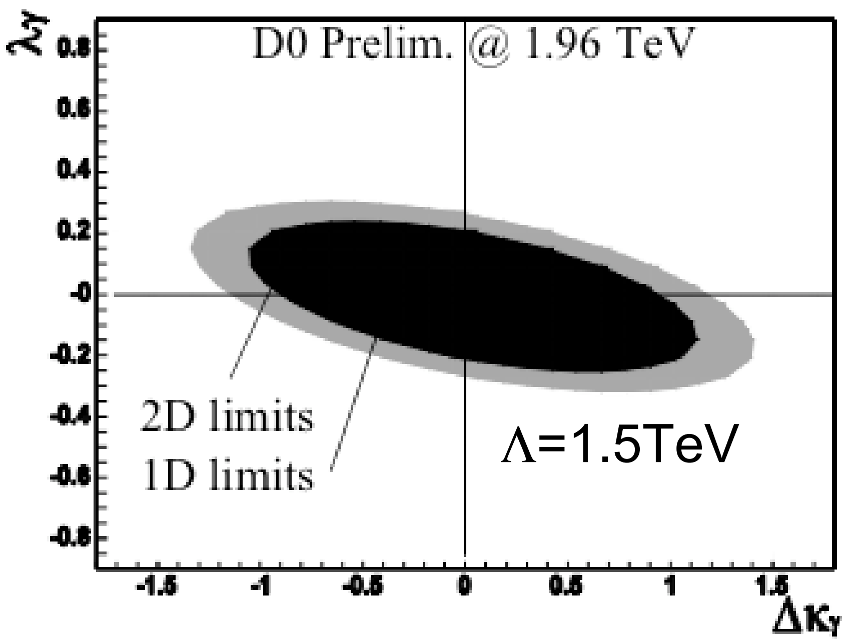
SM expect: $\sigma(W\gamma)$ = 19.3 ± 1.4 pb

*Both experiments quote x-section integral within acceptance

WWγ anomalous coupling





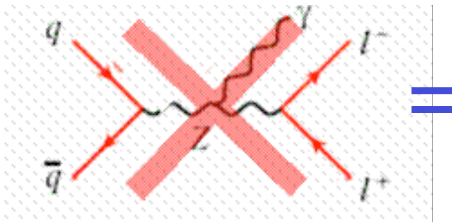


1D limits at 95% CL (D0):

	Tev Run I	Tev Run II	LEP comb.
Δκ	-0.93, 0.94	-0.93, 0.97	-0.105, 0.069
λ	-0.31, 0.29	-0.22, 0.22	-0.059, 0.026

Run I limit on λ already improved!
The tightest at a hadron collider

Zγ production

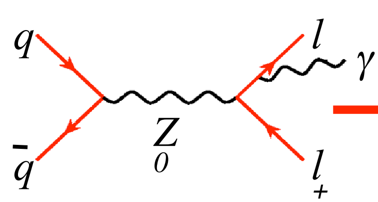


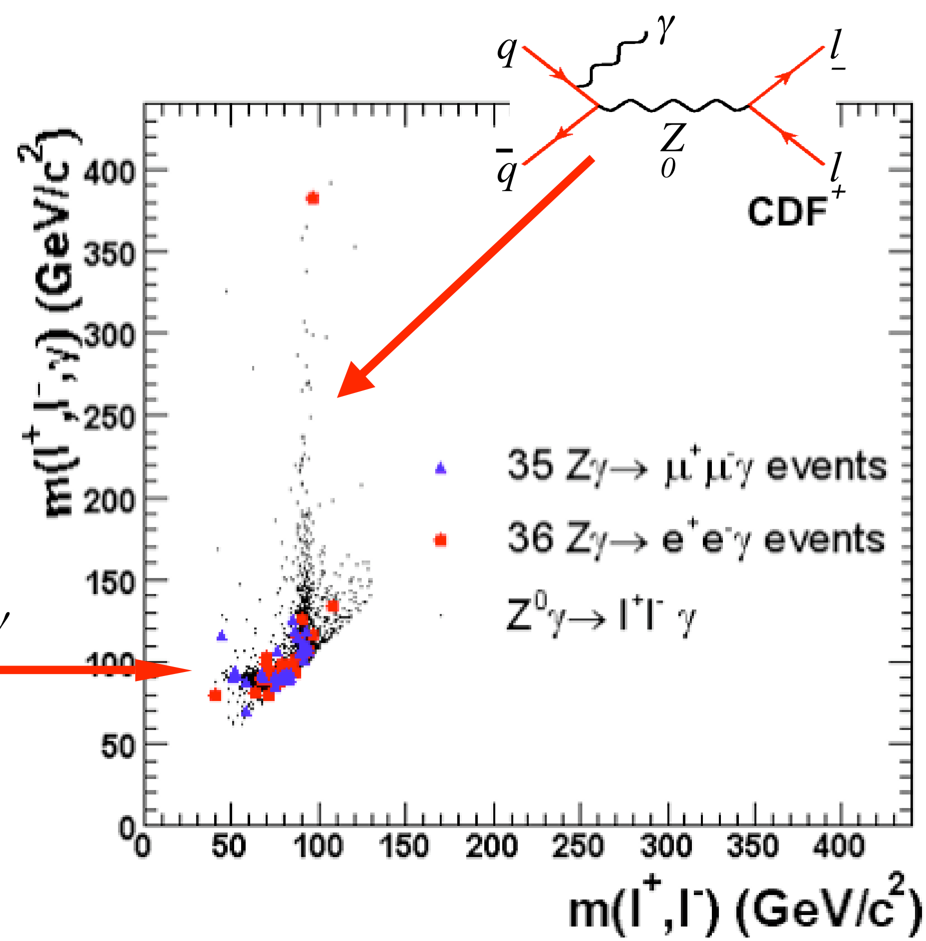
=0 ?

L_{eff} with 8 couplings parameters (h_1^V, h_2^V, h_3^V, h_4^V ; V = Z,γ).
In SM all these couplings =0

- **Zγ selection:**
  - **2 high-P_T isolated leptons**
  - **40<M_{inv}(l,l) <110 GeV**
  - **1 photon |η<1.1| with E_T>7 GeV (8 GeV @ D0),**

- **Main Background = Z+jet where jet mimic a photon (see Wγ)**





Zγ cross section

- **Summary:**

Decay Channel	D0 eeγ	D0 μμγ	CDF eeγ	CDF μμγ
Lum'y (pb^{-1})	324 (6.5%)	286 (6.5%)	202-168 (6%)	192-175 (6%)
SM Zγ	109 ± 7	128 ± 8	31.3 ± 1.6	33.6 ± 1.5

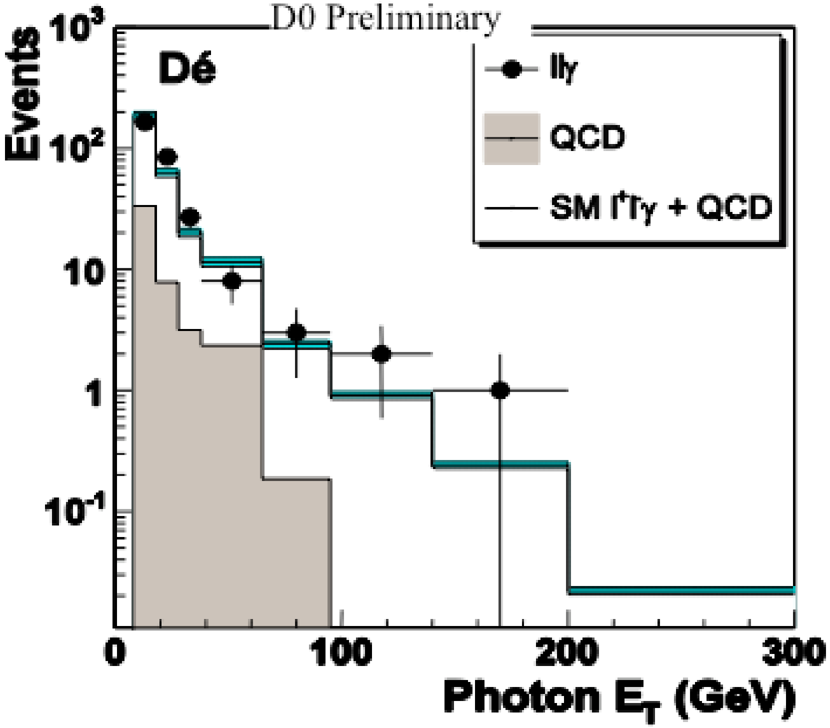
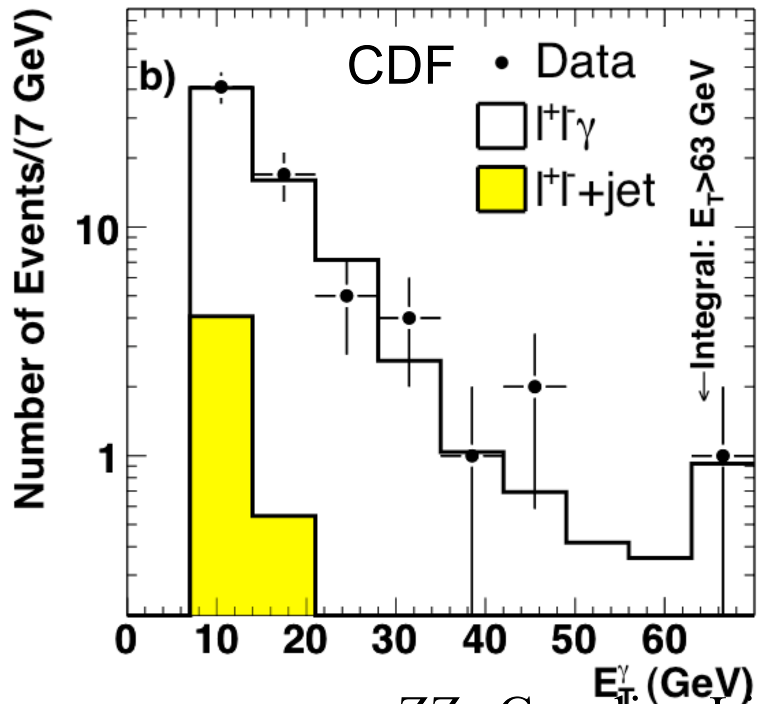
A∗ε	11.3%	11.7%	3.4%	3.7%
σ∗Br(pb)	–	–	4.8±0.8±0.3	4.4±0.8±0.2

- **Combined:**
  - σ(Zγ)*Br(Z ->ll) = 4.6 ± 0.6 pb (CDF)
  - σ(Zγ)*Br(Z ->ll) = 4.2 ± 0.4(stat+syst) ± 0.3 (lumi) pb (D0)
  - SM expectation: 4.5 ± 0.3 (pb)

*Both experiments quote x-section integral within acceptance

Kin. distributions & tri-neutral coupling

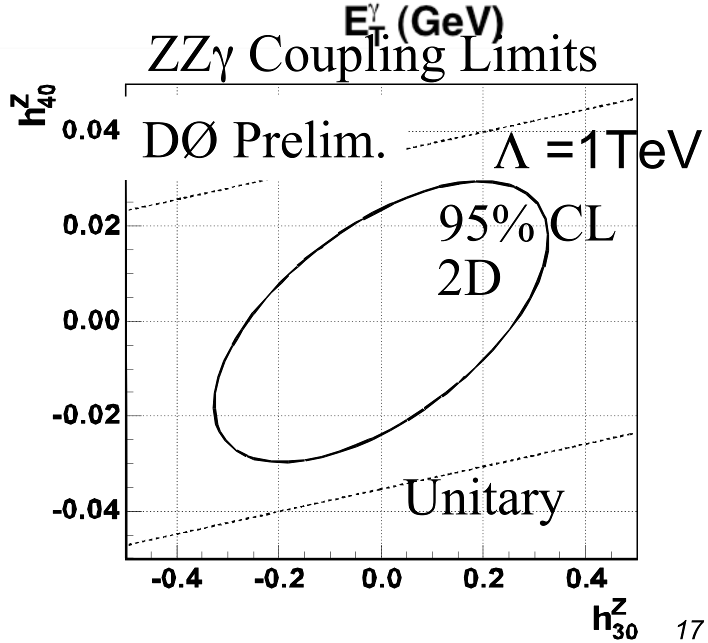




1D limits at 95% CL

LEP	Tevatron (D0)
$-0.049 < h^{\gamma}_{30} < 0.008$	$-0.23 < h^{\gamma}_{30} < 0.23$
$-0.002 < h^{\gamma}_{40} < 0.034$	$-0.019 < h^{\gamma}_{40} < 0.019$
$-0.20 < h^{Z}_{30} < 0.07$	$-0.23 < h^{Z}_{30} < 0.23$
$-0.05 < h^{Z}_{40} < 0.12$	$-0.020 < h^{Z}_{40} < 0.020$

Already better than LEP!



Conclusions

- Most of Run I measurements re-established and/or already improved + new Run II results:
  - Significant number of diboson candidate events
  - Very good agreement with SM
  - CDF and D0 have measured σ(WW) at 1.96 TeV using the dilepton decay channel
  - CDF and D0 have 95% CL on σ(WZ/WZ+ZZ) and D0 has first evidence of WZ production
  - D0 has tightest limit on WWZ anomalous coupling using WZ events.
  - Both CDF and D0 study the Wγ and Zγ production
    - tightest limit on WWγ anomalous coupling at hadron collider

- More to come:
  - CDF and D0 start only exploring the potential of Tevatron Data
  - Radiation amplitude zero (WWγ AC)
  - Use jet channel WW->lνjj
  - Quartic couplings
  - …

WW –>eeνν Event Selection

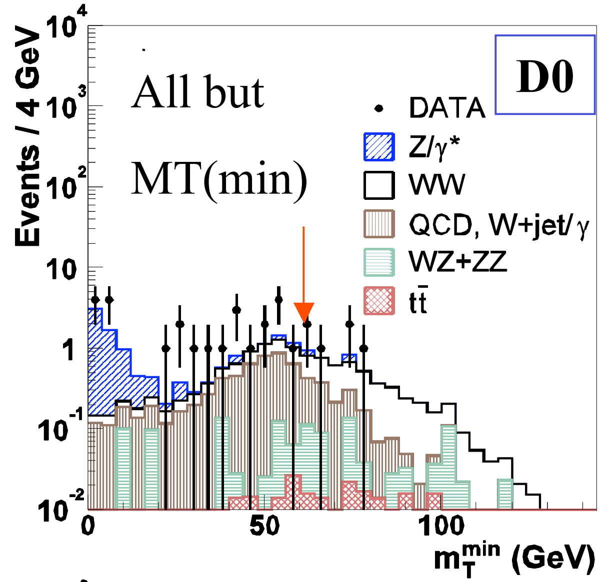
- **ee channel criteria**
  - Minimal Transverse Mass > 60 GeV/c².
  - .NOT. 76<M(ee)<106 GeV/c².
  - “Scaled MET” > 15 rootGeV
  - H_T(jets w/ E_T>20 &|η|<2.5) <50 GeV.

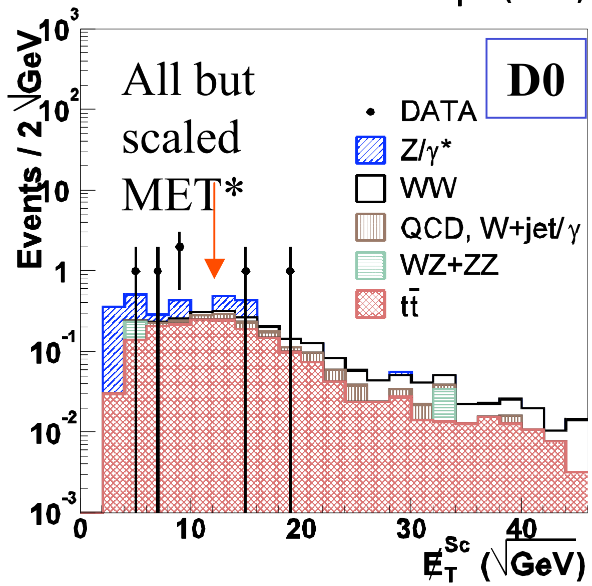
$$\not{E}_T^{Sc} \equiv \frac{\not{E}_T}{\sqrt{\sum_{jets} (\Delta E^{jet} \cdot \sin\theta^{jet} \cdot \cos\Delta\varphi(jet, \not{E}_T))^2}}$$

Remove Z/γ*

Remove Top pairs

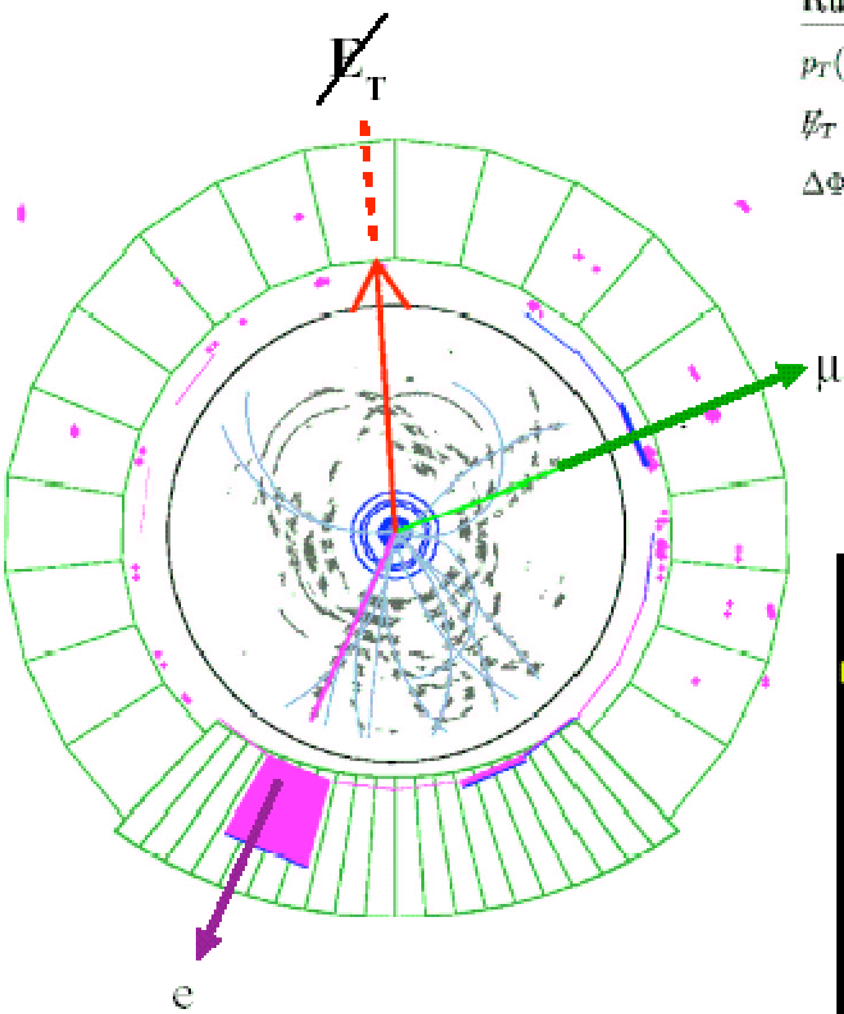
- Background is 2.30+–0.21 events and is 60% W+jets, 40% mixed heavy.
- Eff’y is 8.76+–0.13%.
- Expected signal is 3.42+–0.05 events.
- 6 Candidates Observed.





*Events with jet(s).

WW->eν+μν_μ



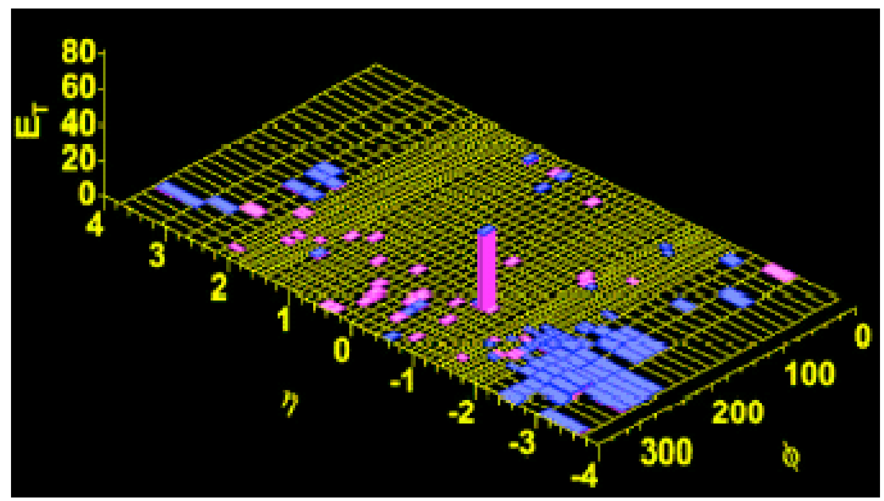
Run 155364 Event 3494901 : $WW \to e^+\nu_e\mu^-\bar{\nu}_\mu$ **Candidate**

$p_T(e) = 42.0$ GeV/c; $p_T(\mu) = 20.0$ GeV/c; $M_{e\mu} = 81.5$ GeV

$\not{E}_T = 64.8$ GeV; $\Phi(\not{E}_T) = 1.6$

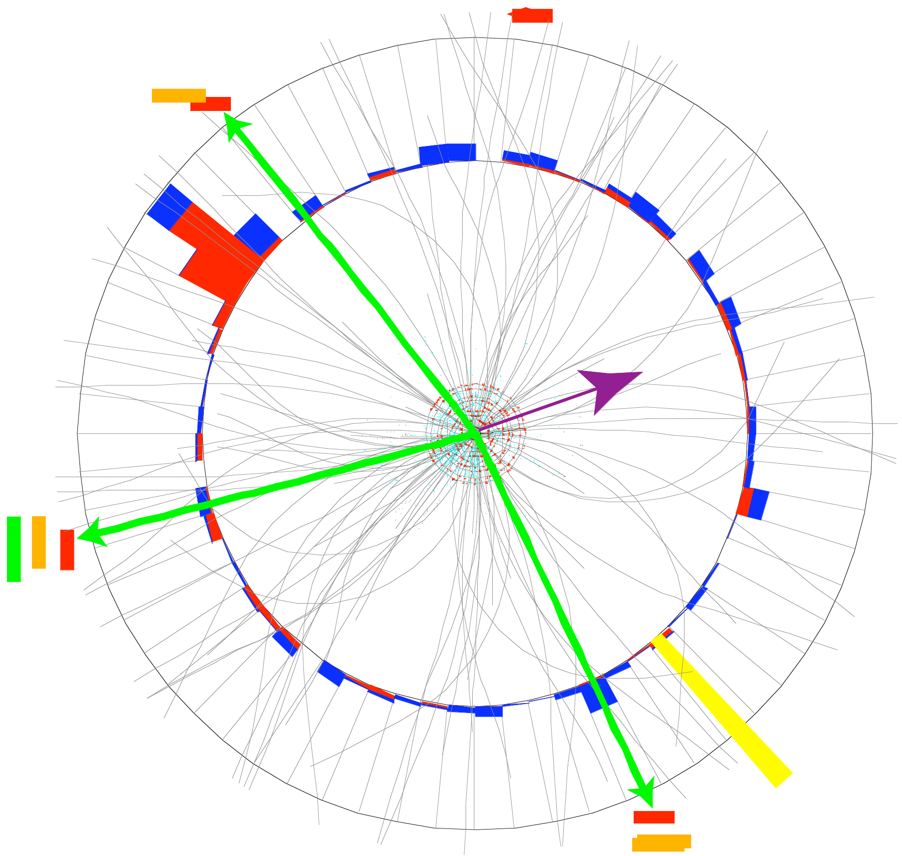
$\Delta\Phi(\not{E}_T, \text{lepton}) = 1.3$; $\Delta\Phi(e,\mu) = 2.4$; Opening-Angle(e,μ)=2.6

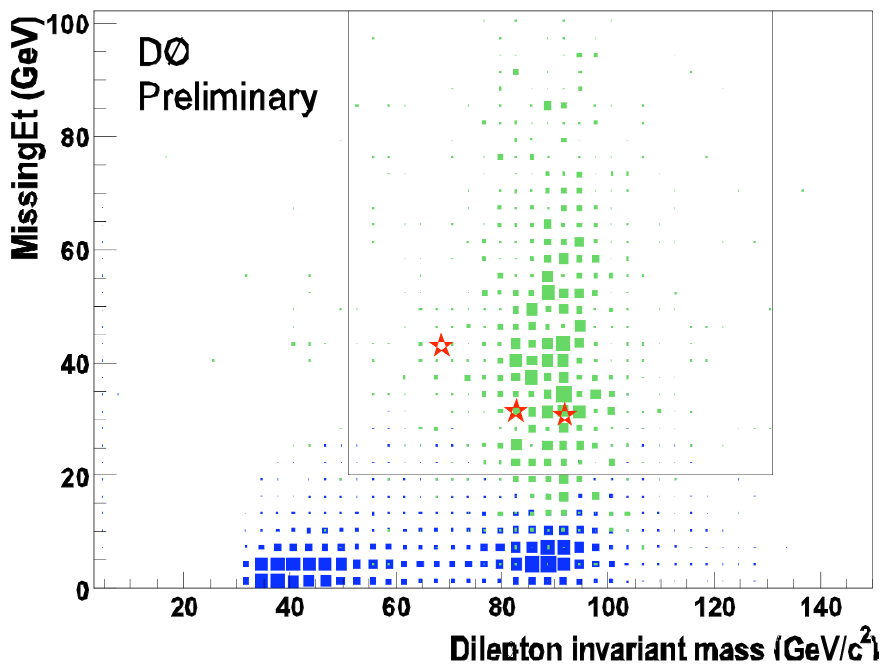
- eμ channel has little Standard Model background
- Signal/Background = 4



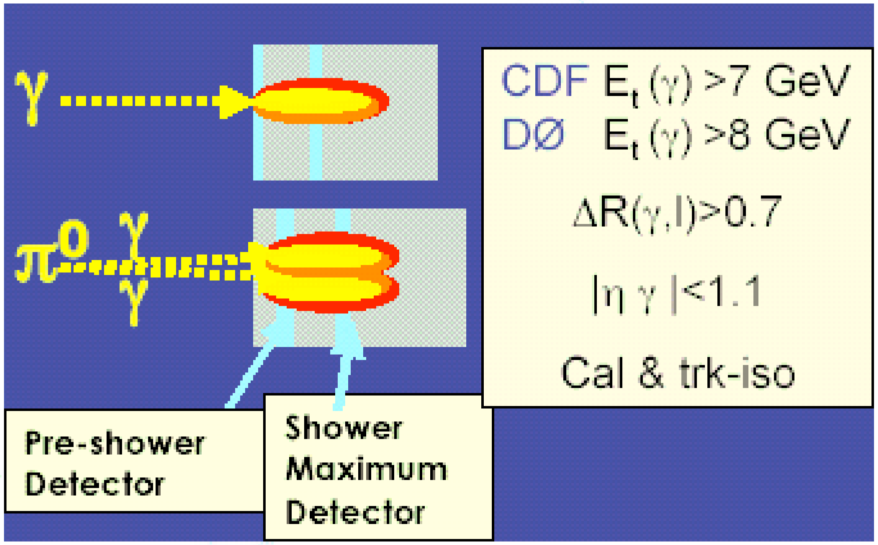
WZ

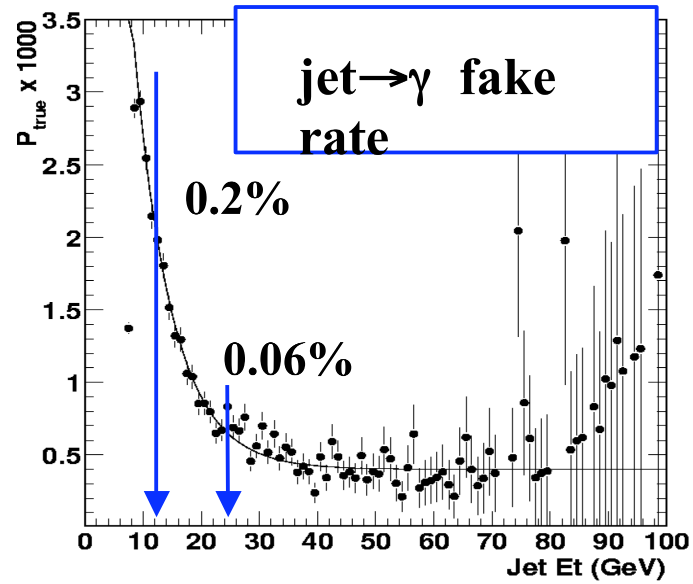
- The 3 events



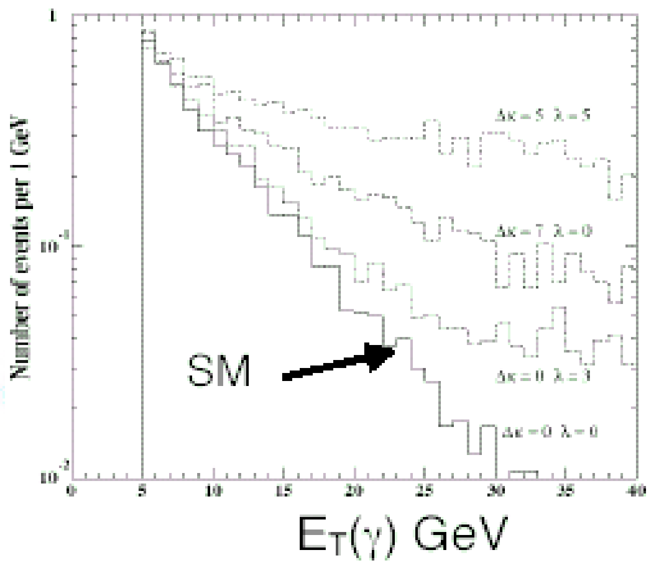


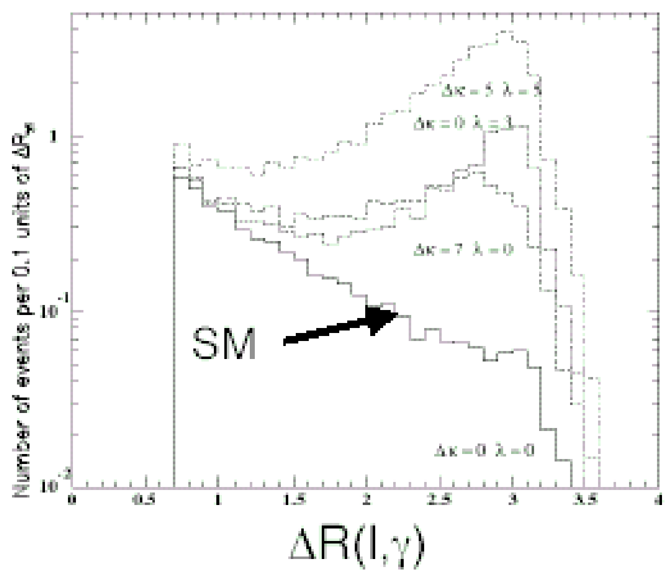
Wγ production





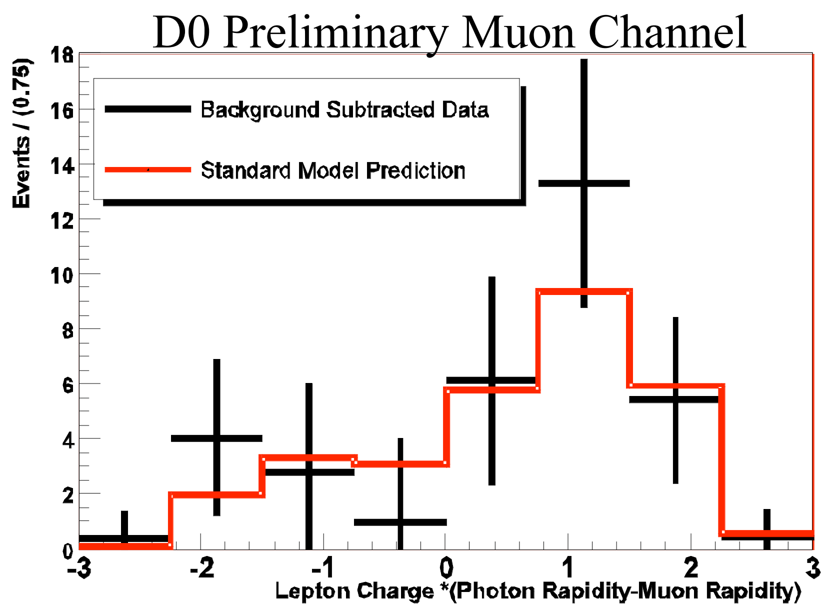
cluster transverse mass $M_T^2(l\gamma, \not{E}_T) = [(M_{l\gamma}^2 + |\vec{p_T}(l) + \vec{p_T}(\gamma)|^2)^{1/2} + \not{E}_T]^2 - |\vec{p_T}(l) + \vec{p_T}(\gamma) + \vec{\not{E}}_T|^2$

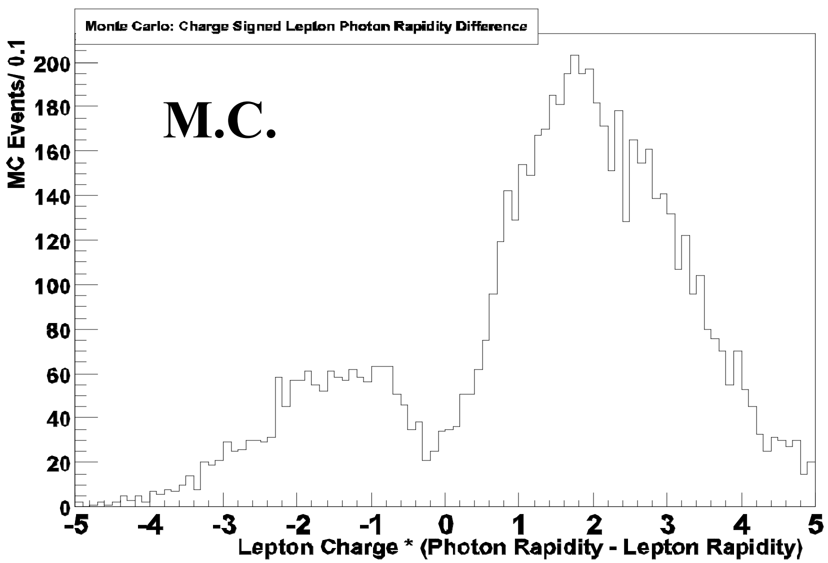




Wγ Radiation Amplitude Zero

- For COS(θ*), the angle between incoming quark and photon in the Wγ rest frame, = –1/3, SM has "amplitude zero".
- For events w/ M_T(cluster)>90 GeV/c^2. One could guess the Wγ rest frame. We use charge-signed $\Delta\eta(l,\gamma)$





- We plot the background-subtracted muon data vs. MC $\Delta\eta(l,\gamma)$ => hints of the Rad. Zero.
- It will help to extend the eta-coverage of electrons and especially of photons.
