

# Suppressed Decays of $B_s$ Mesons

Olga Norriella

UIUC

On behalf of the CDF collaboration

ICHEP, July 22-28, 2010

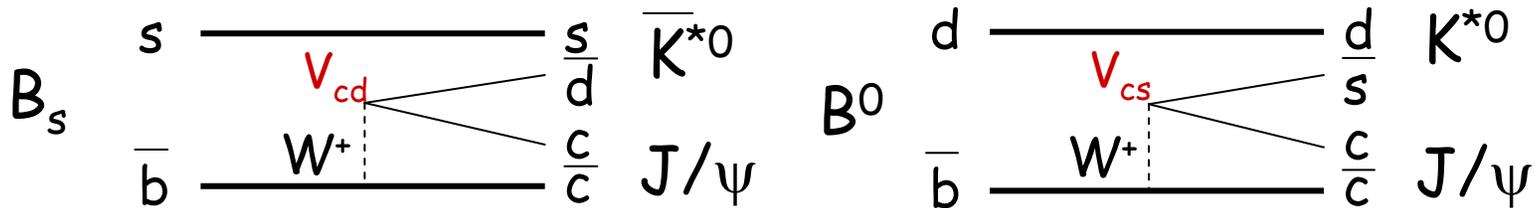

# Motivation

o Most of the  $B_s$  suppressed decays have not been observed yet

$\Rightarrow B_s \rightarrow J/\psi K^*(892)$ ,  $B_s \rightarrow J/\psi K_S$ ,  $B_s \rightarrow J/\psi f^0, \dots$

Only difference is the  $V_{cd}$  contribution vs the  $V_{cs}$

o All of these modes have the possibility of providing further information on lifetime difference and CP asymmetries in  $B_s$  decays.

$\Rightarrow B_s \rightarrow J/\psi K_S$  is a CP eigenstate, measurement of the lifetime in this mode is a direct measurement of  $\tau_{B_s(\text{Heavy})}$

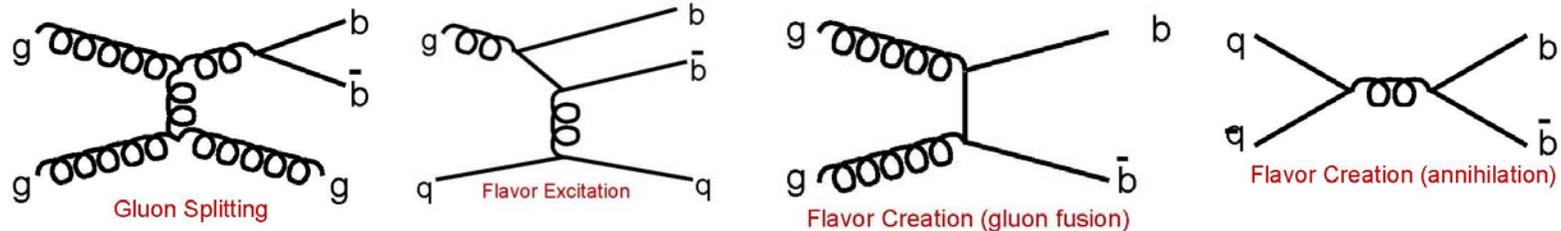

$\Rightarrow B_s \rightarrow J/\psi K_S$  can be used to extract the angle  $\gamma$  of unitary triangle (R. Fleischer, Eur.Phys. J.C10:299-306,1999)

$\Rightarrow B_s \rightarrow J/\psi K^*$  contains an admixture of CP final states, an angular analysis can be done to extract  $\sin(2\beta_s)$  (complementary to  $B_s \rightarrow J/\psi f^0$ )

# B production at Tevatron

- o Tevatron is a source of all B-hadron species:  $B_d$ ,  $B_u$ ,  $B_c$ ,  $B_s$  and  $\Lambda_b$   
 $\Rightarrow$  At CDF the  $\sigma_b = 29.4 \pm 0.6 \pm 6.2 \mu\text{b}$  ( $|\eta| < 1$ )

- o Some of them are not produced at the B-factories

$$\Rightarrow B_s, B_c, B^{**}, B_s^{**}, \Lambda_b, \Sigma_b, \Xi_b, \dots$$

- o More decays are accessible thanks to the amount of luminosity collected

$$\Rightarrow \text{CDF has more than } 7.5 \text{ fb}^{-1} \text{ on tape}$$

- o CDF has excellent mass resolution, vertex resolution and trigger system for flavor physics

# Measurements

## o Branching ratio measurement

$$\frac{\text{Br}(B_s \rightarrow J/\psi h)}{\text{Br}(B^0 \rightarrow J/\psi h)} = \frac{N(B_s \rightarrow J/\psi h)}{N(B^0 \rightarrow J/\psi h)} * \frac{f_d}{f_s} * A_{\text{rel}} \quad \text{where } h = K_S \text{ or } K^*$$

↑  
Branching ratio of  $B_s$  relative to  $B^0$

↑  
Yield of  $B_s$  and  $B^0$  events (from data)

↑  
Fragmentation fractions (from CDF result)

↑  
Relative Acceptance (from MC)

## o Analysis strategy

⇒ Reconstruct  $B \rightarrow J/\psi K^*$  and  $B \rightarrow J/\psi K_S$  from a large sample of di-muon ( $J/\psi \rightarrow \mu^+ \mu^-$  decays)

⇒ Apply specific optimization cuts to remove backgrounds

⇒ Likelihood fit to the invariant mass distribution to get the ratio of yields<sub>4</sub>

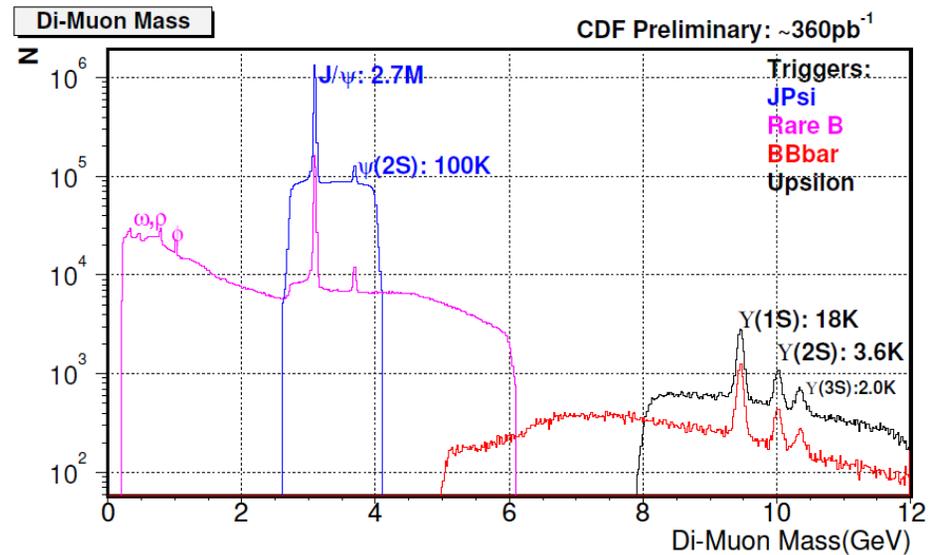

# Reconstruction

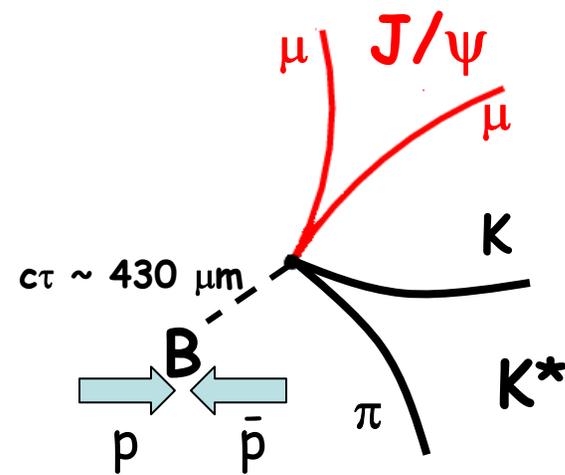

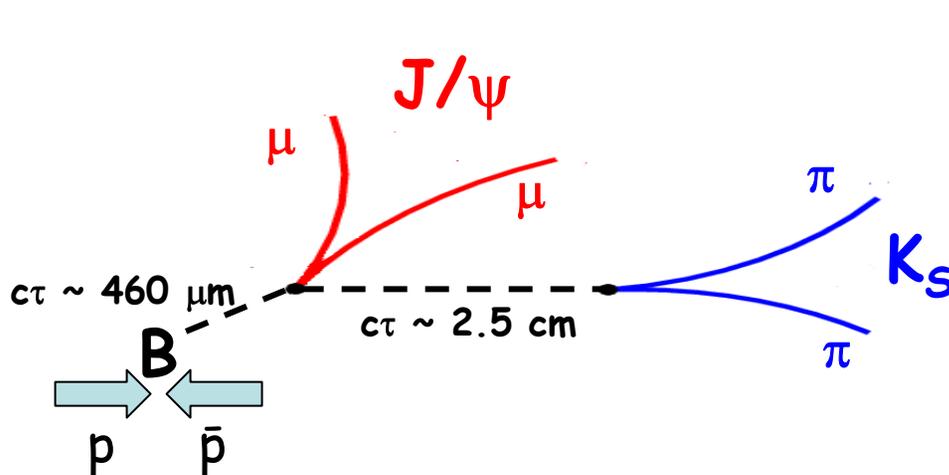

## o Data from di-muon triggers

⇒  $J/\psi$  triggers, mainly looking for:

- two low  $p_T$  muons :  $p_T > 1.5 \text{ GeV}/c^2$
- two muons have opposite charge
- $\Delta\phi$  (between 2 muons)  $< 120$  degrees

## o Reconstruction

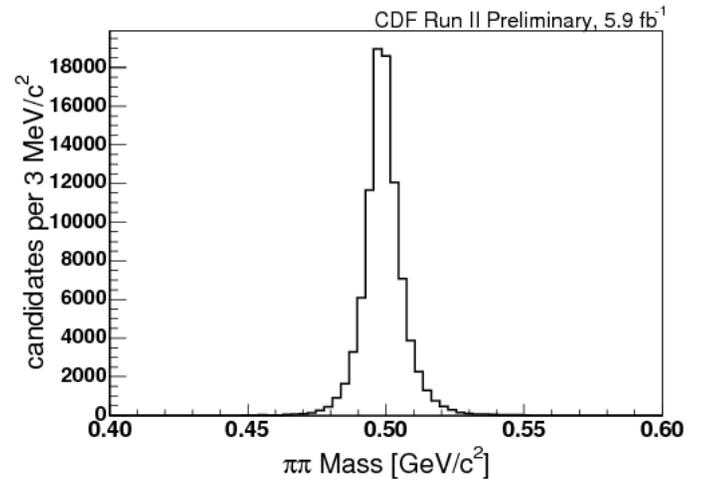

# $B \rightarrow J/\psi K_S$ Analysis

o Advantage:  $K_S$  has a long life ( $c\tau \sim 2.5$  cm) and is a narrow resonance

$\Rightarrow$  easy to get a pure  $K_S$  sample

o Disadvantage: expecting small  $B_s$  signal

$\Rightarrow$  important to suppress combinatorial background contribution

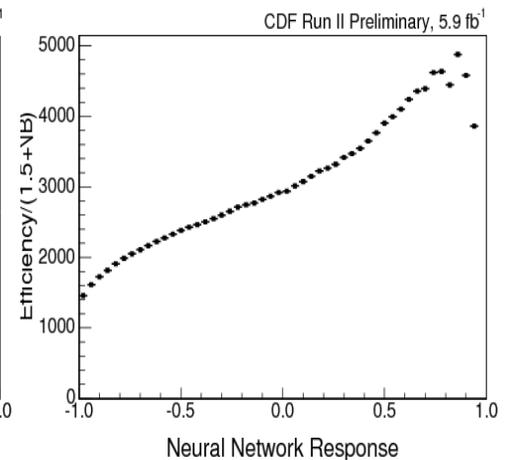

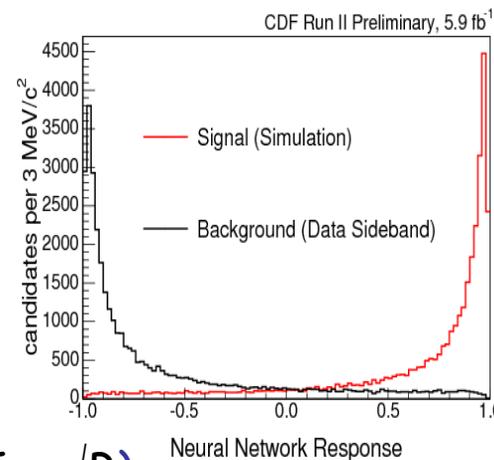

o A Neural Network is used to discriminate between signal and combinatorial background

$\Rightarrow$  22 different kinematic variables  
 $p_T$ ,  $d_0$ ,  $c\tau$ , helicity angles, mass,...

$\Rightarrow$  Trained using  $B_s$  MC for **Signal** and data sideband for BKG

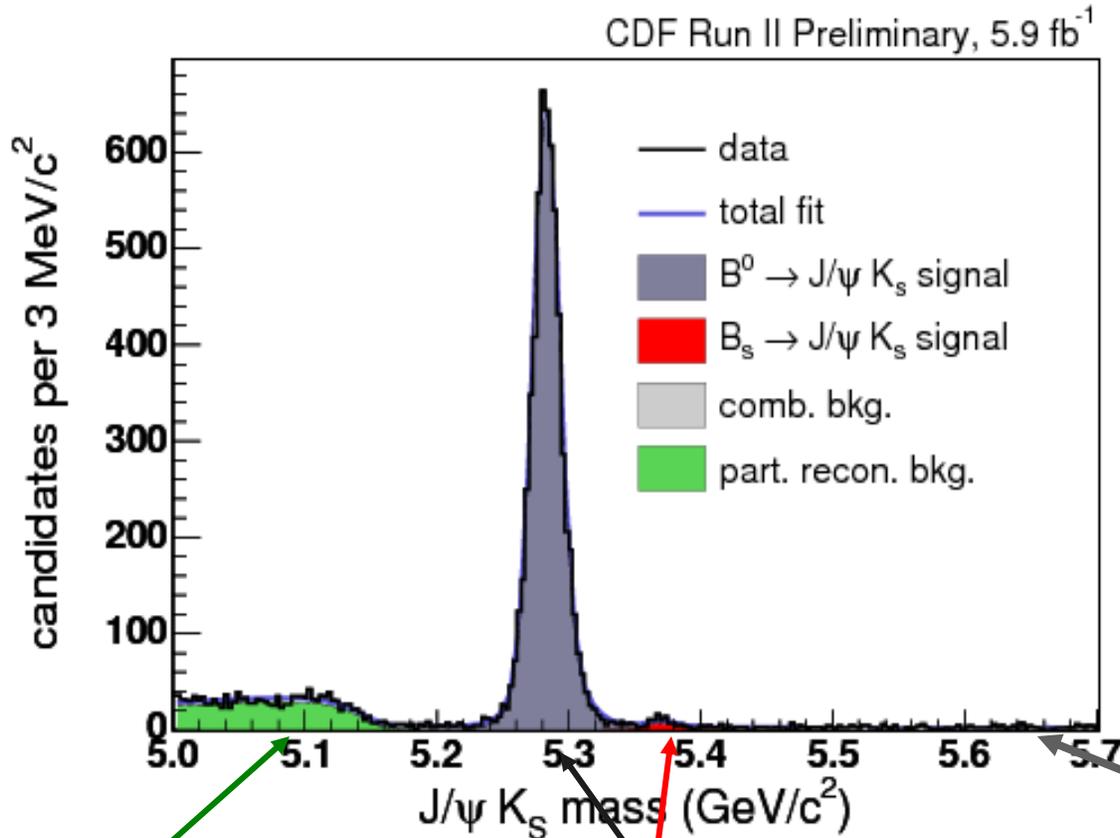

$\Rightarrow$  Optimization procedure geared towards maximizing efficiency/ $(1.5 + \sqrt{B})$

# Fit contributions for $B \rightarrow J/\psi K_S$

The invariant mass distribution is fitted with binned Likelihood

## Signal

$B^0$  and  $B_s$  decays

## Background

- Partial reconstruction multibody decays where  $\pi$ ,  $K$  or  $\gamma$  missing
- Combinatorial background
- $\Lambda_b \rightarrow J/\psi \Lambda$  contribution  
Negligible after specific cut

Argus function convoluted with a Gaussian

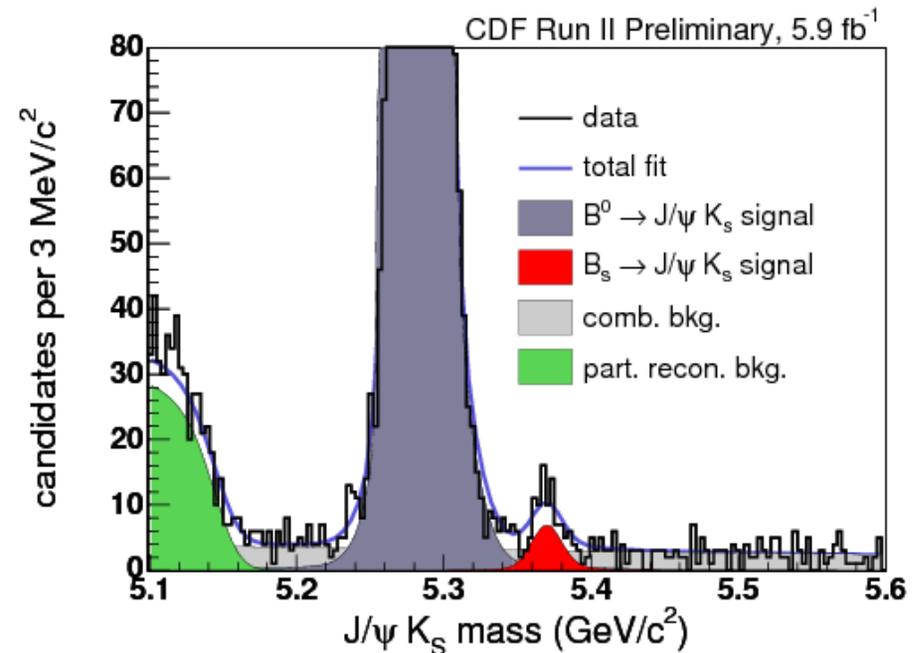

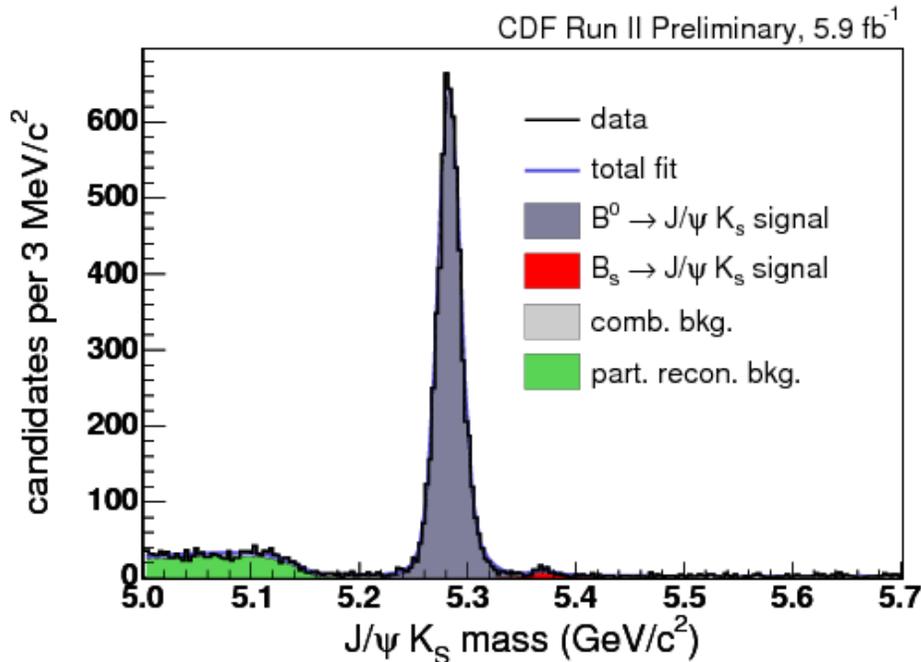

3 Gaussian template extracted from  $B^0$  simulation  
Use  $m(B_s) - m(B^0)$  for extrapolation

Exponential function

# First observation of $B_s \rightarrow J/\psi K_S$ !!!

$$\frac{\text{Br}(B_s \rightarrow J/\psi K_S)}{\text{Br}(B^0 \rightarrow J/\psi K_S)} = \frac{N(B_s \rightarrow J/\psi K_S)}{N(B^0 \rightarrow J/\psi K_S)} * \frac{f_d}{f_s} * A_{\text{rel}}$$

$$N(B^0) = 5954 \pm 79 ; N(B_s) = 64 \pm 14 ; N(B_s)/N(B^0) = 0.0108 \pm 0.0019$$

o The p-value for  $B_s$  signal compared to the background hypothesis

$$p\text{-value} = 3.85 \cdot 10^{-13} \quad \text{or} \quad 7.2\sigma$$

# $B \rightarrow J/\psi K^*$ Analysis

o Disadvantage:  $K^*$  is not a long-lived particle and is a wider resonance

⇒ more background contributions to deal with

o Advantage: expecting bigger  $B_s$  signal

⇒ not necessary sophisticated tools to remove combinatorial background

o Rectangular cuts optimization to maximize  $\text{efficiency}/(1.5 + \sqrt{B})$

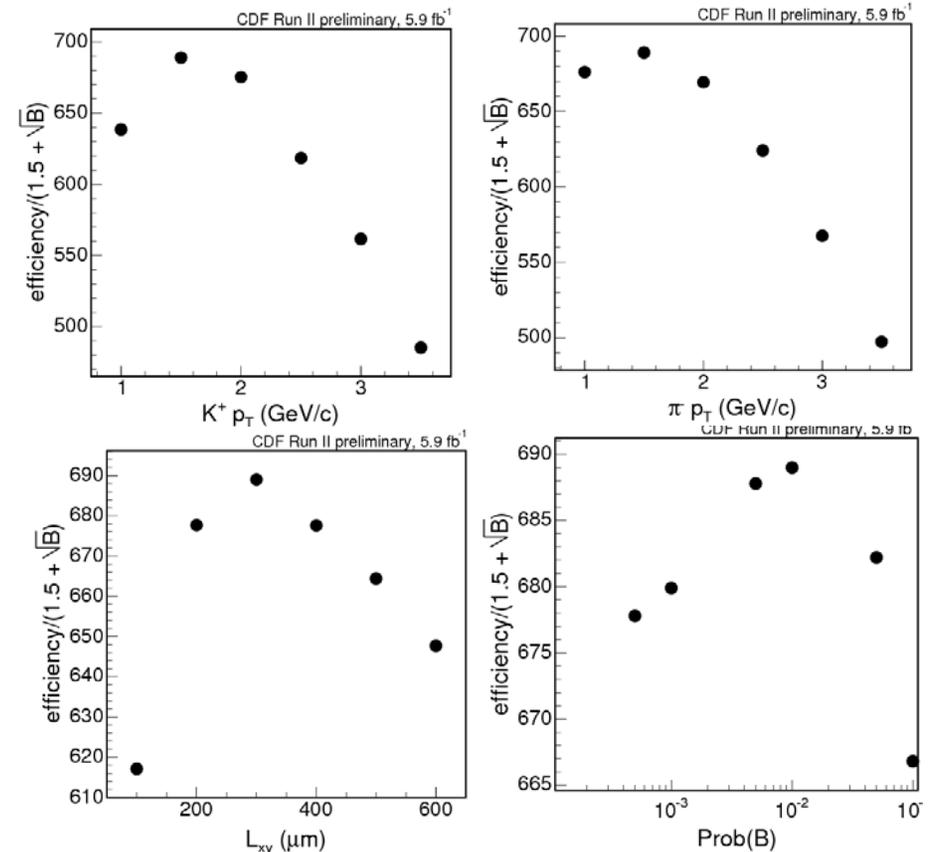

$$p_T(B) > 6 \text{ GeV}/c$$

$$\text{Flight distance } L_{xy}(B) > 300 \mu\text{m}$$

$$\text{Impact parameter } d_{xy}(B) < 50 \mu\text{m}$$

$$\text{Fit vertex Probability}(B) > 0.01$$

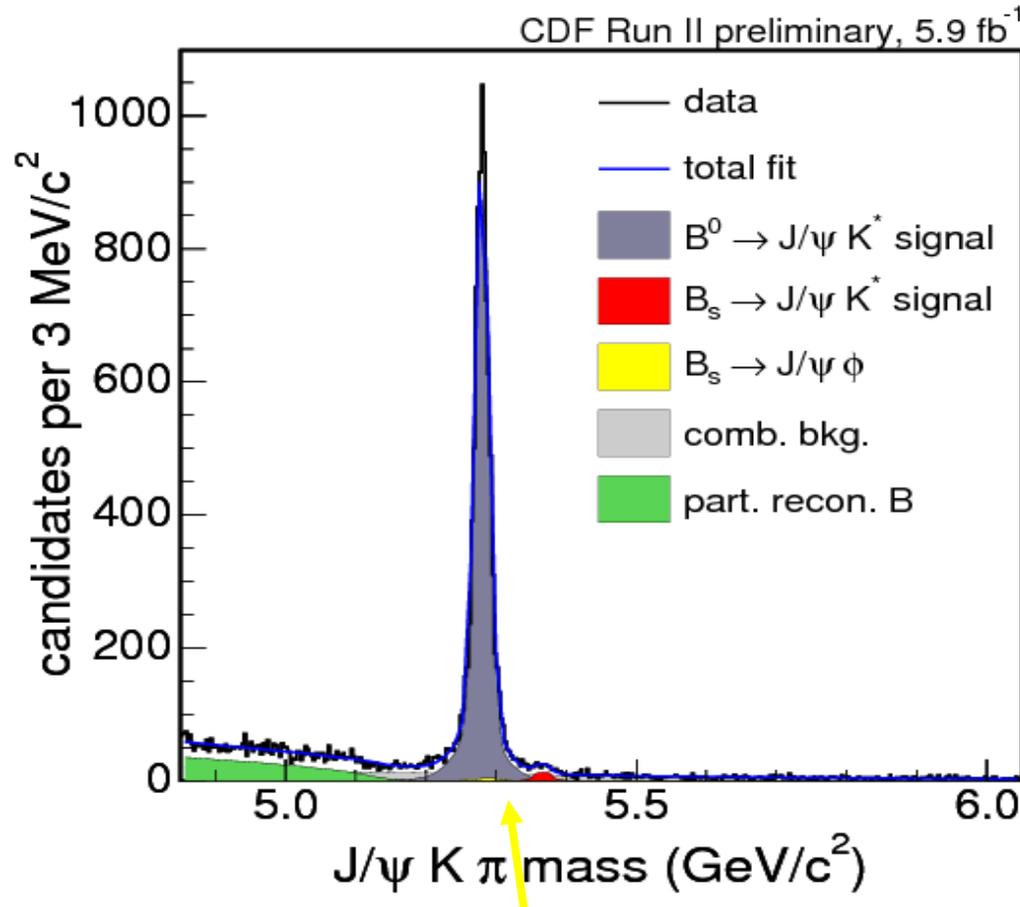

$$p_T(K^+, \pi^-) > 1.5 \text{ GeV}/c$$

# Fit contributions for $B \rightarrow J/\psi K^*$

o Same contributions than in the  $B \rightarrow J/\psi K_S$  analysis plus additional backgrounds

## Signal

$B^0$  and  $B_s$  decays

## Background

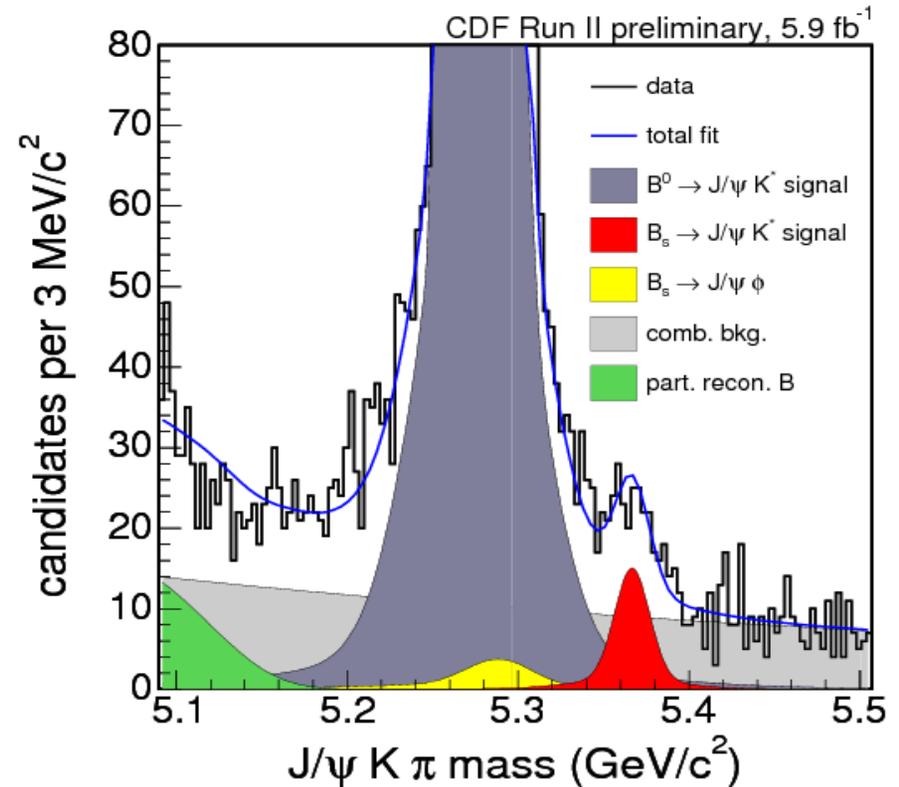

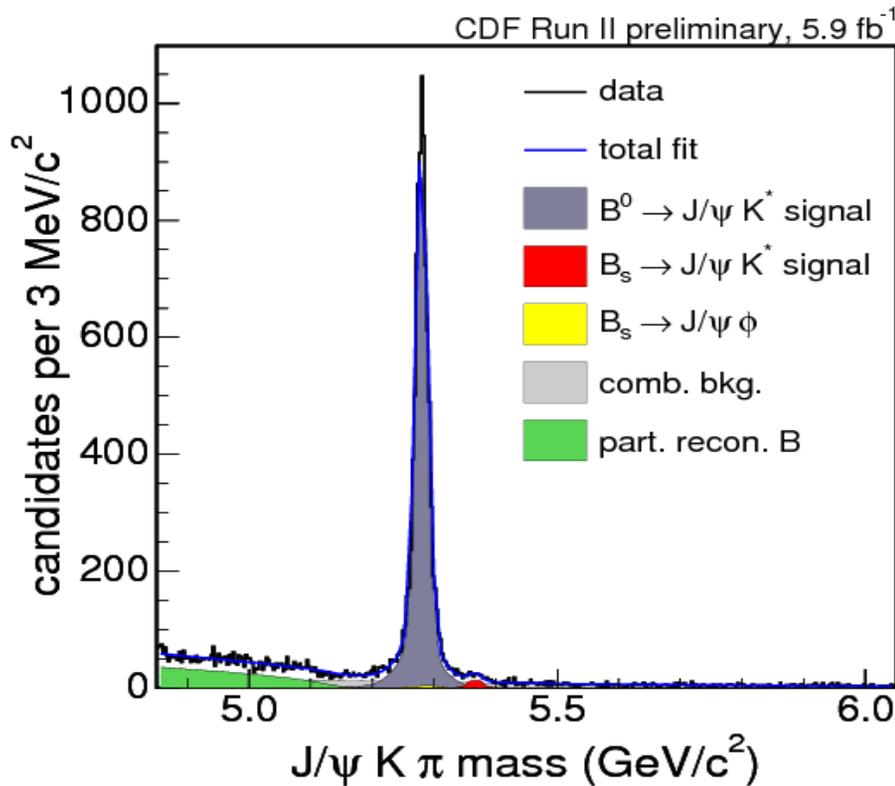

- Partial reconstruction
  - Combinatorial background
  - $B_s \rightarrow J/\psi \phi$  contribution
  - $B_s \rightarrow J/\psi f^0$  contribution
- last one is negligible

$B_s \rightarrow J/\psi \phi$  modeled by 2 Gaussians template

Extracted from simulation but contribution constrained using data

# First observation of $B_s \rightarrow J/\psi K^*$ !!!

$$N(B^0) = 9530 \pm 110 ; N(B_s) = 151 \pm 25 ; N(B_s)/N(B^0) = 0.0159 \pm 0.0022$$

o The p-value for  $B_s$  signal compared to the background hypothesis

$$p\text{-value} = 8.9 \cdot 10^{-16} \text{ or } 8\sigma$$

# Systematic uncertainties

Difference sources of systematic uncertainties have been considered

Sources	$B \rightarrow J/\psi K^*$	$B \rightarrow J/\psi K_S$
Signal modeling	4.4 %	4.6%
Mass difference ( $B_s - B^0$ )	$\sim 0.1\%$	$\sim 0.1\%$
Combinatorial background (different modeling)	1.25%	5.6%
Combinatorial background (fixing the contribution)	31%	5.6%
$B_s \rightarrow J/\psi \phi$	1.25%	-

$B \rightarrow J/\psi K^*$

$N(B_s)/N(B^0) = 0.0159 \pm 0.0022$  (stat.)  $\pm 0.0050$  (sys.)

$B \rightarrow J/\psi K_S$

$N(B_s)/N(B^0) = 0.0108 \pm 0.0019$  (stat.)  $\pm 0.0010$  (sys.)

# Relative Acceptance Calculation

$$\frac{\text{Br}(B_s \rightarrow J/\psi h)}{\text{Br}(B^0 \rightarrow J/\psi h)} = \frac{N(B_s \rightarrow J/\psi h)}{N(B^0 \rightarrow J/\psi h)} * \frac{f_d}{f_s} * A_{\text{rel}}$$

o Relative Acceptance evaluation using simulation

$$A_{\text{rel}} = \frac{N(B^0 \rightarrow J/\psi K_s \text{ passed})/N(B^0 \rightarrow J/\psi K_s \text{ generated})}{N(B_s \rightarrow J/\psi K_s \text{ passed})/N(B_s \rightarrow J/\psi K_s \text{ generated})}$$

$$B \rightarrow J/\psi K^* \quad A_{\text{rel}} = 1.057 \pm 0.010 \text{ (stat)} \pm 0.263 \text{ (sys.)}$$

$$B \rightarrow J/\psi K_s \quad A_{\text{rel}} = 1.012 \pm 0.010 \text{ (stat)} \pm 0.042 \text{ (sys.)}$$

o Systematic uncertainties

Source	$B \rightarrow J/\psi K^*$	$B \rightarrow J/\psi K_s$
$c\tau$ in $B^0$ and $B_s$ MC	0.9%	2.8%
$p_T$ spectrum	2.7%	3%
polarization	24.6%	-

# Recap of all numbers

$$\frac{\text{Br}(B_s \rightarrow J/\psi h)}{\text{Br}(B^0 \rightarrow J/\psi h)} = \frac{N(B_s \rightarrow J/\psi h)}{N(B^0 \rightarrow J/\psi h)} * \frac{f_d}{f_s} * A_{\text{rel}} \quad \text{where } h = K_S \text{ or } K^*$$

$\Rightarrow N(B_s \rightarrow J/\psi h)/N(B^0 \rightarrow J/\psi h)$  :

$$B \rightarrow J/\psi K^* \quad 0.0159 \pm 0.0022 \text{ (stat.)} \pm 0.0050 \text{ (sys.)}$$

$$B \rightarrow J/\psi K_S \quad 0.0108 \pm 0.0019 \text{ (stat.)} \pm 0.0010 \text{ (sys.)}$$

$\Rightarrow f_s/f_d$  from CDF( Phys.Rev. D77, 072003 (2008))  
combined with new PDG value for  $\text{Br}(D_s \rightarrow \phi\pi)$

$$0.269 \pm 0.033$$

$\Rightarrow A_{\text{rel}}$  :

$$1.057 \pm 0.010 \text{ (stat)} \pm 0.263 \text{ (sys)}$$

$$1.012 \pm 0.010 \text{ (stat)} \pm 0.042 \text{ (sys)}$$

# Branching Ratios Measurement

$$\frac{\text{Br}(B_s \rightarrow J/\psi K^*)}{\text{Br}(B^0 \rightarrow J/\psi K^*)} = 0.062 \pm 0.009 \text{ (stat.)} \pm 0.025 \text{ (sys.)} \pm 0.008 \text{ (frag.)}$$

$$\frac{\text{Br}(B_s \rightarrow J/\psi K_S)}{\text{Br}(B^0 \rightarrow J/\psi K_S)} = 0.041 \pm 0.007 \text{ (stat.)} \pm 0.004 \text{ (sys.)} \pm 0.005 \text{ (frag.)}$$

⇒ Using PDG values:  $\text{Br}(B^0 \rightarrow J/\psi K^*) = (1.33 \pm 0.06) * 10^{-3}$

$$\text{Br}(B^0 \rightarrow J/\psi K^0) = (8.71 \pm 0.32) * 10^{-4}$$

$$\text{Br}(B_s \rightarrow J/\psi K^*) = (8.3 \pm 1.2 \text{ (stat.)} \pm 3.3 \text{ (sys.)} \pm 1.0 \text{ (frag.)} \pm 0.4 \text{ (PDG)}) * 10^{-5}$$

$$\text{Br}(B_s \rightarrow J/\psi K^0) = (3.5 \pm 0.6 \text{ (stat.)} \pm 0.4 \text{ (sys.)} \pm 0.4 \text{ (frag.)} \pm 0.1 \text{ (PDG)}) * 10^{-5}$$

# Summary

o Two new Cabibbo and color suppressed decays of  $B_s$  mesons have been observed by CDF :  $B_s \rightarrow J/\psi K^*$  and  $B_s \rightarrow J/\psi K_S$

⇒ significance greater than  $7\sigma$

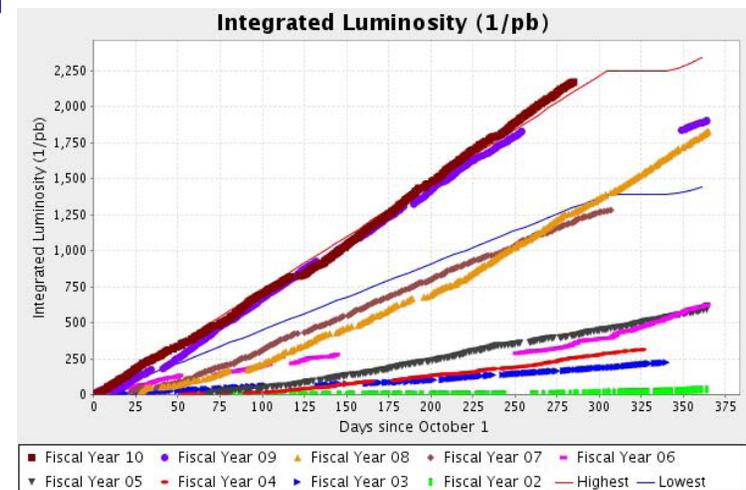

o A preliminary measurement of their Branching Ratios relative to the  $B^0$  decays have been done

⇒ For  $K^*$  :  $0.062 \pm 0.009$  (stat.)  $\pm 0.025$  (sys.)  $\pm 0.008$  (frag.)

⇒ For  $K_S$  :  $0.041 \pm 0.007$  (stat.)  $\pm 0.004$  (sys.)  $\pm 0.005$  (frag.)

o These modes are going to provide further information on lifetime difference and CP asymmetries in  $B_s$  decays

o CDF is collecting a lot of more events every hour...so stay tuned because more decays are coming soon

---

Back up

# Signals and Background Contributions

Both analysis have some common Background contributions and signals

- o Signals ( $B^0$  and  $B_s$ ) templates are obtained from simulation ( $B^0$  MC)

$$f_{B^0} = N_{B^0} \cdot \left( \frac{f_1}{\sigma_1 \sqrt{2\pi}} e^{-(x-\mu_1)^2/2\sigma_1^2} + \frac{f_2}{\sigma_2 \sqrt{2\pi}} e^{-(x-\mu_2)^2/2\sigma_2^2} + \frac{f_3}{\sigma_3 \sqrt{2\pi}} e^{-(x-\mu_3)^2/2\sigma_3^2} \right)$$

The same template for  $B^0$  and  $B_s$  taking into account  $\Delta m = 86.8 \text{ MeV}/c^2$

- o Combinatorial background

$$f_{comb}(x) = N_0 \cdot e^{C_0 x}$$

Exponential function  
(Float in the final fit)

- o Partial reconstruction contribution for 5 bodies  $B^0$  decays

$$f_{ARGUS}(x) = N_1 \cdot \sqrt{1 - \frac{x^2}{m_0^2}} \cdot e^{-C_1 \frac{x^2}{m_0^2}}$$

Argus function  
 $m_0$  cut off  $\sim 5.14$   
mass ( $B^0$ )-mass ( $\pi^0$ )

# More Backgrounds

$B \rightarrow J/\psi K^*$  analysis has more backgrounds that need to be modeled

o  $B_s \rightarrow J/\psi \phi$

⇒ Templates are obtained from simulation: **2 Gaussians (Fixed in the final fit)**

⇒ Contribution constrained using  $B_s \rightarrow J/\psi \phi$  data sample

o Partial reconstruction contribution for 5 bodies  $B_s$  decays

⇒ modeled with another **ARGUS function**

•  $m_0$  cut off at **5.22 GeV/c<sup>2</sup> : mass ( $B_s$ )-mass( $\pi^0$ )**

⇒ exponential constant constrained to be identical to the previous one

Background studied but considered negligible contributions

o In  $B \rightarrow J/\psi K^*$  analysis:  $B \rightarrow J/\psi f_0$

o In  $B \rightarrow J/\psi K_s$  analysis:  $\Lambda_b \rightarrow J/\psi \Lambda$
