

Error Handling

➤ Current Status

Framework for consumer : GenericDmode class for Dmode calibration has been used.

flow diagram of GenericDmode class

Problem :

- database update after error display :
In case database has problem, it can not be displayed.
- Sometimes display error happens :
ACE sometimes forgot xhost + from his terminal which allows display error handling canvas, in this case, consumer crashes before filling database.
- So, GenericDmode class is not enough to realize the algorithm of the previous page.

➤ Solution

The best solution is to have TofDmodeClass which is modified version of GenericDmode class, in order to do something after filling database.
