

Monitoring & Control Systems

- PC Administrators Meeting
 - FNAL (Windows NT) domain disappears end of 2004
 - Implies all machines go to Windows 2000/XP, here on FERMI domain
 - Don't know if this implies our "critical system" could not be a new and different Windows NT domain
 - How do we do this while taking data? But there will be a September shutdown
 - Time to start thinking about this now
- TOF problems have diminished but not disappeared entirely
 - Found fixing TOF "daisy chain" with 50 ohm terminator on end broke Daniele's code (tuned for bad "daisy chain"?)
- ICICLE
 - COT understanding due in part to current info stored via ICICLE and displayed from VOLTMAN (thanks Margherita & Larry!)
 - runControl complaining about no "heartbeat" from ICICLE; is there some task on SOLENOID2 slowing response?
